## 1000 WATT FXW SERIES DC/DC CONVERTERS

## Description

The 4:1 Input Voltage 1000 Watt Single FXW DC/DC converter provides a precisely regulated dc output. The output voltage is fully isolated from the input, allowing the output to be positive or negative polarity and with various ground connections. The 1000 Watt FXW meets the most rigorous performance standards in an industry standard footprint for mobile ( 12 Vin ), process control ( 24 V in) , and military COTS ( 28 V in) applications.

The 4:1 Input Voltage 1000W FXW includes trim and remote ON/OFF. Threaded through holes are provided to allow easy mounting or addition of a heatsink for extended temperature operation.

The converters high efficiency and high power density are accomplished through use of high-efficiency synchronous rectification technology, advanced electronic circuit, packaging and thermal design thus resulting in a high reliability product. Converter operates at a fixed frequency and follows conservative component de-rating guidelines.

Product is designed and manufactured in the USA.

## Features

- 4:1 Input voltage range
- High power density
- Small size $2.5^{\prime \prime} \times 4.7^{\prime \prime} \times 0.52^{\prime \prime}$
- Efficiency up to $96 \%$
- Excellent thermal performance with metal case
- Over-Current and Short Circuit Protection
- Over-Temperature protection
- Auto-restart
- Monotonic startup into pre bias
- Constant frequency
- Remote ON/OFF
- Good shock and vibration damping
- Temperature Range $-40^{\circ} \mathrm{C}$ to $+105^{\circ} \mathrm{C}$ Available.
- RoHS Compliant
- UL60950 Approved* (except 24S12.84FXW (RoHS))

| Model | Input Range <br> VDC |  | Vout <br> VDC | lout <br> ADC |
| :--- | :---: | :---: | :---: | :---: |
|  | Min | Max |  | 84 |
| 24S12.84FXW (ROHS)* | 9 | 36 | 12 | 84 |
| 24S24.42FXW (ROHS) | 9 | 36 | 24 | 42 |
| 24S28.36FXW (ROHS) | 9 | 36 | 28 | 36 |
| 24S48.21FXW (ROHS) | 9 | 36 | 48 | 21 |
| 24S53.19FXW (ROHS) | 9 | 36 | 53 | 19 |

* The 24S12.84FXW is under evaluation but not currently UL60950 Approved.

1. Negative Logic ON/OFF feature available. Add "-N" to the part number when ordering.
i.e. 24S24.42FXW-N (ROHS)
2. Designed to meet MIL-STD-810G for functional shock and vibration. The unit must be properly secured to the interface medium (PCB/Chassis) by use of the threaded inserts of the unit.
3. A thermal management device, such as a heatsink, is required to ensure proper operation of this device. The thermal management medium is required to maintain baseplate $<105^{\circ} \mathrm{C}$ for full rated power.
4. Non-Standard output voltages are available. Please contact the factory for additional information.

## 1000 WATT FXW SERIES DC/DC CONVERTERS

## Electrical Specifications

Conditions: TA $=25^{\circ} \mathrm{C}$, Airflow $=300$ LFM ( $1.5 \mathrm{~m} / \mathrm{s}$ ), Vin $=24 \mathrm{VDC}$, unless otherwise specified. Specifications are subject to change without notice.

Figure A: Output Power as function of input voltage.

## Operations

## Input Fusing

The FXW converters do not provide internal fusing and therefore in some applications external input fuse may be required. Use of external fuse is also recommended if there is possibility for input voltage reversal. For greatest safety, it is recommended to use fast blow fuse in the ungrounded input supply line.

## Input Reverse Polarity Protection

The FXW converters do not have input reverse polarity. If input voltage polarity is reversed, internal diodes will become forward biased and draw excessive current from the power source. If the power source is not current limited or input fuse not used, the converter could be permanently damaged.

## Input Undervoltage Protection

Input undervoltage lockout is standard with this converter. The FXW converter will start and regulate properly if the ramping-up input voltage exceeds Turn-on threshold of typ. 8.5V (See Specification) and remains at or above Turn-on Threshold.
The converter will turn off when the input voltage drops below the Turn-off Threshold of typical 8 V (See specification) and converter enters hiccup mode and will stay off for 2 seconds. The converter will restart after 2 seconds only if the input voltage is again above the Turnon Threshold.
The built-on hysteresis and 2 second hiccup time prevents any unstable on/off operation at the low input voltage near Turn-on Threshold.
User should take into account for IR and inductive voltage drop in the input source and input power lines and make sure that the input voltage to the converter is always above the Turn-off Threshold voltage under ALL OPERATING CONDITIONS.

## Start-Up Time

The start-up time is specified under two different scenarios: a) Startup by ON/OFF remote control (with the input voltage above the Turn-on Threshold voltage) and b) Start-up by applying the input voltage (with the converter enabled via ON/OFF remote control).
The startup times are measured with maximum resistive load as: a) the interval between the point when the ramping input voltage crosses the Turn-on Threshold and the output voltage reaches $90 \%$ of its nominal value and b) the interval between the point when the converter is enabled by ON/OFF remote control and time when the output voltage reaches $90 \%$ of its nominal value.

When converter is started by applying the input voltage with ON/OFF pin active there is delay of 500 msec that was intentionally provided to prevent potential startup issues especially at low input voltages

## Input Source Impedance

Because of the switching nature and negative input impedance of DC/DC converters, the input of these converters must be driven from the source with both low AC impedance and DC input regulation.
The FXW converters are designed to operate without external components as long as the source voltage has very low impedance and reasonable voltage regulation. However, since this is not the case in most applications an additional input capacitor is required to provide proper operations of the FXW converter. Specified values for input capacitor are recommendation and need to be adjusted for particular application. Due to large variation between applications some experimentation may be needed.
In many applications, the inductance associated with the distribution from the power source to the input of the converter can affect the stability and in some cases, if excessive, even inhibit operation of the converter. This becomes of great consideration for input voltage at 12 V or below.
The DC input regulation, associated with resistance between input power source and input of the converter, plays significant role in particular in low input voltage applications such as 12 V battery systems.
Note that input voltage at the input pins of the connector must never degrade below Turn-off threshold under all load operating conditions.
Note that in applications with high pulsating loads additional input as well as output capacitors may be needed. In addition, for EMI conducted measurement, due to low input voltage it is recommended to use $5 \mu \mathrm{H}$ LISNs instead of typical $50 \mu \mathrm{H}$ LISNs.

## Input/ Output Filtering

## Input Capacitor

Minimum required input capacitance, mounted close to the input pins of the converter, is $1000 \mu \mathrm{~F}$ with $\mathrm{ESR}<0.1 \Omega$.
Several criteria need to be met when choosing input capacitor: a) type of capacitor, b) capacitance to provide additional energy storage, c) RMS current rating, d) ESR value that will ensure that output impedance of the input filter is lower than input impedance of the converter and its variation over the temperature.
Since inductance of the input power cables could have significant voltage drop due to rate of change of input current $d i(i n) / d t$ during transient load operation, an external capacitor on the output of the converter is

## 1000 WATT FXW SERIES DC/DC CONVERTERS

required to reduce $d i(\mathrm{in}) / d t$. Another constraint is minimum rms current rating of the input capacitors which is application dependent. One component of input rms current handled by input capacitor is high frequency component at switching frequency of the converter (typ. 400 kHz ) and is specified under "Input terminal ripple current" $\boldsymbol{i}_{\mathrm{c}}$. Typical values at full rated load and 24 Vin are provided in Section "Characteristic Waveforms" for each model and are in range of $2.5 \mathrm{~A}-3.6 \mathrm{~A}$. It is recommended to use ceramic capacitors for attenuating this component for input terminal ripple current, which is also required to meet requirement for conducted EMI (See EMI Section). The second component of the input ripple current is due to pulsating load current being reflected to the input and electrolytic capacitors usually used for this purpose need to be selected accordingly. Using several electrolytic capacitors in parallel on the input is recommended.
ESR of the electrolytic capacitors, need to be carefully chosen taken into account temperature dependence.

## Output Capacitor

Similar considerations apply for selecting external output capacitor. For additional high frequency noise attenuation use of ceramic capacitors is recommended while in order to provide stability of the converter during high pulsating load high value electrolytic capacitor is required. It is recommended to use several electrolytic capacitors in parallel in order to reduce effective ESR. Note that external output capacitor also reduces slew rate of the input current during pulsating load transients as discussed above.
Table 1 shows recommend external output capacitance.

## ON/OFF (Pins 1 and 2)

The ON/OFF pin is used to turn the power converter on or off remotely via a system signal and has positive logic. A typical connection for remote ON/OFF function is shown in
Fig. 1.

Fig. 1: Circuit configuration for ON/OFF function.
The positive logic version turns on when the ON/OFF pin is at logic high and turns off when at logic low. The converter is on when the ON/OFF pin is either left open or external voltage greater than 2 V and not more than 12 V is
applied between ON/OFF pin and - INPUT pin. See the Electrical Specifications for logic high/low definitions.

The negative logic version turns on when the ON/OFF pin is at logic low and turns off when at logic high. The converter is on when the ON/OFF pin is either shorted to INPUT pin or kept below 0.8 V . The converter is off when the ON/OFF pin is either left open or external voltage not more than 12 V is applied between ON/OFF pin and INPUT pin. See the Electrical Specifications for logic high/low definitions.
The ON/OFF pin is internally pulled up to typically 4.5 V via resistor and connected to internal logic circuit via RC circuit in order to filter out noise that may occur on the ON/OFF pin. A properly de-bounced mechanical switch, open-collector transistor, or FET can be used to drive the input of the ON/OFF pin. The device must be capable of sinking up to 0.36 mA at a low level voltage of $\leq 0.8 \mathrm{~V}$. During logic high, the typical maximum voltage at ON/OFF pin (generated by the converter) is 4.5 V , and the maximum allowable leakage current is $160 \mu \mathrm{~A}$. If not using the remote on/off feature leave the ON/OFF pin open.

TTL Logic Level - The range between 0.81 V and 2 V is considered the dead-band. Operation in the dead-band is not recommended.
External voltage for ON/OFF control should not be applied when there is no input power voltage applied to the converter.

## Output Overcurrent Protection (OCP)

The converter is protected against overcurrent or short circuit conditions. Upon sensing an overcurrent condition, the converter will switch to constant current operation and thereby begin to reduce output voltage. When the output voltage drops below approx. $50 \%$ of the nominal value of output voltage, the converter will shut down.
Once the converter has shut down, it will attempt to restart nominally every 2 seconds. The attempted restart will continue indefinitely until the overload or short circuit conditions are removed or the output voltage rises above $50 \%$ of its nominal value.
Once the output current is brought back into its specified range, the converter automatically exits the hiccup mode and continues normaloperation.
During initial startup if output voltage does not exceed typical $50 \%$ of nominal output voltage within 500 msec after the converter is enabled, the converter will be shut down and will attempt to restart after 2 seconds.
In case of startup into short circuit, internal logic detects short circuit condition and shuts down converter typical 5 msec after condition is detected. The converter will attempt to restart after 2 seconds until short circuit condition exists.

## 1000 WATT FXW SERIES DC/DC CONVERTERS

Output Overvoltage Protection (OVP)
The converter will shut down if the output voltage across +OUT (Pins 5 and 6) and -OUT (Pins 8 and 9) exceeds the threshold of the OVP circuitry. The OVP circuitry contains its own reference, independent of the output voltage regulation loop. Once the converter has shut down, it will attempt to restart every 2 seconds until the OVP condition is removed.

Note that OVP threshold is set for nominal output voltage and not trimmed output voltage value or remote sense voltage.

## Overtemperature Protection (OTP)

The FXW converters have non-latching overtemperature protection. It will shut down and disable the output if temperature at the center of the base plate exceeds a threshold of typical $108^{\circ} \mathrm{C}$ for $9 \mathrm{Vin}, 112{ }^{\circ} \mathrm{C}$ for 12 Vin and $115{ }^{\circ} \mathrm{C}$ for $24 \mathrm{Vin} / 36 \mathrm{Vin}$. Measured with FXW converter soldered to 5" x 3.5" x 0.07 " 4 layers/ 2 Oz Cooper FR4 PCB.

The converter will automatically restart when the base temperature has decreased by approximately $20^{\circ} \mathrm{C}$.

## Safety Requirements

Basic Insulation is provided between input and the output. The converters have no internal fuse. To comply with safety agencies requirements, a fast-acting or time-delay fuse is to be provided in the unearthed lead. Recommended fuse values are:
a) 140 A for $9 \mathrm{~V}<\mathrm{Vin}<18 \mathrm{~V}$
b) 90 A for $18 \mathrm{~V}<\mathrm{Vin}<36 \mathrm{~V}$.

## Electromagnetic Compatibility (EMC)

EMC requirements must be met at the end-product system level, as no specific standards dedicated to EMC characteristics of board mounted component dc-dc converters exist.

With the addition of a two stage external filter, the FXW converters will pass the requirements of MILSTD-461F CE102 Base Curve for conducted emissions. Note that 5uH LISN should be used in order to enable operation of the converter at low input voltage.

Remote Sense Pins (Pins 10 and 11)
Sense inputs compensate for output voltage inaccuracy delivered at the load.

Fig. 2: Circuit configuration for Remote sense function.
The sense input and power Vout pins are internally connected through $100 \Omega$ (SENSE+ to +OUT) and $10 \Omega$ (SENSE- to -OUT) resistors enabling the converter to operate without external connection to the Sense. If the Sense function is not used for remote regulation, the user should connect SENSE- (Pin 10) to -OUT (Pins 8 and 9) and SENSE+ (Pin 11) to +OUT (Pins 5 and 6) at the converter pins.
Sense lines must be treated with care in PCB layouts and should run adjacent to DC signals. If cables and discrete wiring is used, it is recommended to use twisted pair, shielded tubing or similar techniques.

The maximum voltage difference between Sense inputs and corresponding power pins should be kept below 1 V , i.e.:
$\mathrm{V}($ SENSE + ) $-\mathrm{V}(+O U T) \leq 1 \mathrm{~V}$
$\mathrm{V}(-\mathrm{OUT})-\mathrm{V}($ SENSE- $) \leq 1 \mathrm{~V}$
Note that maximum output power is determined by maximum output current and highest output voltage at the output pins of the converter:
$[\mathrm{V}(+\mathrm{OUT})-\mathrm{V}(-\mathrm{OUT})] x$ lout $\leq$ Pout rated

## Output Voltage Adjust/TRIM (Pin 12)

The TRIM (Pin 12) allows user to adjust output voltage $10 \%$ up or $-40 \%$ down relative to rated nominal voltage by addition of external trim resistor. Trim resistor should be mounted close to the converter and connected with short leads. Internal resistor in the converter used for the TRIM is high precision $0.1 \%$ with temperature coefficient 25 $\mathrm{ppm} /{ }^{\circ} \mathrm{C}$. The accuracy of the TRIM is therefore determined by tolerance of external Trim resistor. If trimming is not used, the TRIM pin should be left open.

## Trim Down - Decrease Output Voltage

Trimming down is accomplished by connecting an external resistor, Rtrim-down, between the TRIM (pin 12) and the SENSE- (pin 10), with a value of:

Rtrim-down $=\left(\frac{499}{\Delta}-9.98\right)[k \Omega]$
Where,
Rtrim-down $=$ Required value of the trim-down resistor $[\mathrm{k} \Omega$ ]
$\mathrm{V}_{\text {(NOм) }}=$ Nominal value of output voltage [V]
$\mathrm{V}_{\mathrm{O}(\mathrm{REQ})}=$ Required value of output voltage [V]
$\Delta=\left|\frac{\mathrm{VO}(\mathrm{REQ})-\mathrm{VO}(\mathrm{NOM})}{\mathrm{VO}(\mathrm{NOM})}\right| \quad[\%]$

Fig. 3: Circuit configuration for Trim-down function
To trim the output voltage $10 \%(\Delta=10)$ down, required external trim resistance is:
Rtrim-down $=\left(\frac{499}{10}-9.98\right)=39.92 \mathrm{k} \Omega$

## Trim Up - Increase Output Voltage

Trimming up is accomplished by connecting an external resistor, Rtrim-up, between the TRIM (pin 12) and the SENSE+ (pin 11), with a value of:

Rtrim-up $=4.99 *\left\{\left[\frac{\mathrm{VO}(\mathrm{NOM}) *(100+\Delta)}{1.25 \Delta}\right]-\frac{(100+2 \Delta)}{\Delta}\right\} \quad[\mathrm{k} \Omega]$

Fig. 4: Circuit configuration for Trim-up function

To trim the output voltage up, for example 24 V to 26.4 V , $\Delta=10$ and required external resistor is:

Rtrim-up $=4.99 *\left\{\left[\frac{24 *(100+10)}{1.25 * 10}\right]-\frac{(100+2 * 10)}{10}\right\}=1015 \mathrm{k} \Omega$
Note that trimming output voltage more than $10 \%$ is not recommended and OVP may be tripped.

## Active Voltage Programming

In applications where output voltage need to be adjusted actively, an external voltage source, such as for example a Digital-to-Analog converter (DAC), capable of both sourcing and sinking current can be used. It should be connected across with series resistor Rg across TRIM (Pin 12) and SENSE- (Pin 10). External trim voltage should not be applied before converter is enabled in order to provide proper startup output voltage waveform and prevent tripping overvoltage protection. Please contact Calex technical representative for more details.

## Thermal Consideration

The FXW converter can operate in a variety of thermal environment. However, in order to ensure reliable operation of the converter, sufficient cooling should be provided. The FXW converter is encapsulated in plastic case with metal baseplate on the top. In order to improve thermal performance, power components inside the unit are thermally coupled to the baseplate. In addition, thermal design of the converter is enhanced by use of input and output pins as heat transfer elements. Heat is removed from the converter by conduction, convection and radiation.
There are several factors such as ambient temperature, airflow, converter power dissipation, converter orientation how converter is mounted as well as the need for increased reliability that need to be taken into account in order to achieve required performance. It is highly recommended to measure temperature in the middle of the baseplate in particular application to ensure that proper cooling of the converter is provided.
A reduction in the operating temperature of the converter will result in an increased reliability.

## Thermal Derating

There are two most common applications: 1) the FXW converter is thermally attached to a cold plate inside chassis without any forced internal air circulation; 2) the FXW converter is mounted in an open chassis on system board with forced airflow with or without an additional heatsink attached to the base plate of the FXW converter.

The best thermal results are achieved in application 1) since the converter is cooled entirely by conduction of heat

## 1000 WATT FXW SERIES DC/DC CONVERTERS

from the top surface of the converter to a cold plate and temperature of the components is determined by the temperature of the cold plate. There is also some additional heat removal through the converter's pins to the metal layers in the system board. It is highly recommended to solder pins to the system board rather than using receptacles. Typical derating output power and current are shown in Figs. 17-26 for various baseplate temperatures up to $105^{\circ} \mathrm{C}$. Note that operating converter at these limits for prolonged time will affect reliability.

## Soldering Guidelines

The ROHS-compliant through-hole FXW converters use $\mathrm{Sn} / \mathrm{Ag} / \mathrm{Cu}$ Pb-free solder and ROHS-compliant component. They are designed to be processed through wave soldering machines. The pins are $100 \%$ matte tin over nickel plated and compatible with both Pb and $\mathrm{Pb}-$ free wave soldering processes. It is recommended to follow specifications below when installing and soldering FXW converters. Exceeding these specifications may cause damage to the FXW converter.

| Wave Solder Guideline For Sn/Ag/Cu based solders |  |
| :--- | :---: |
| Maximum Preheat Temperature | $115^{\circ} \mathrm{C}$ |
| Maximum Pot Temperature | $270^{\circ} \mathrm{C}$ |
| Maximum Solder Dwell Time | 7 seconds |
| Wave Solder Guideline For Sn/Pb based solders |  |
| Maximum Preheat Temperature |  |
| Maximum Pot Temperature | $105^{\circ} \mathrm{C}$ |
| Maximum Solder Dwell Time | $250^{\circ} \mathrm{C}$ |

FXW converters are not recommended for water wash process. Contact the factory for additional information if water wash is necessary.

| C1, C2, C12, C14 | $470 \mu \mathrm{~F} / 50 \mathrm{~V} / 70 \mathrm{~m} \Omega$ Electrolytic Capacitor (Vishay MAL214699108E3 or equivalent) |
| C3, C4, C5, C6 | $4.7 \mathrm{nF} / 1210 / \mathrm{X} 7 \mathrm{R} / 1500 \mathrm{~V}$ Ceramic Capacitor |
| C7, C8, C9, C10, C11, C13 | $10 \mu \mathrm{~F} / 1210 / \mathrm{X} 7 \mathrm{R} / 50 \mathrm{~V}$ Ceramic Capacitor |
| L1 | CM choke, 130uH, Leakage $=0.6 \mathrm{uH}$ (4T on toroid $22.1 \mathrm{~mm} \times 13.7 \mathrm{~mm} \times 7.92 \mathrm{~mm}$ ) |

Fig. 57: Typical input EMI filter circuit to attenuate conducted emissions per MILSTD-461F CE102 Base Curve.

Fig. 58: Input conducted emissions measurement (Typ.) of 24S24.42FXW.

## 1000 WATT FXW SERIES DC/DC CONVERTERS

Mechanical Specification

Input/ Output Connections

| Pin | Label | Function |
| :---: | :---: | :--- |
| 1 | +ON/OFF | TTL input with internal pull up, referenced to -- <br> ON/OFF pin, used to turn converter on and off |
| 2 | -ON/OFF | Negative input of Remote ON/OFF |
| 3 | -INPUT | Negative Input Voltage |
| 3 A | -INPUT | Negative Input Voltage |
| 4 | +INPUT | Positive Input Voltage |
| 4 A | +INPUT | Positive Input Voltage |
| 5 | +OUT | Positive Output Voltage |
| 6 | +OUT | Positive Output Voltage |
| 8 | -OUT | Negative Output Voltage |
| 9 | -OUT | Negative Output Voltage |
| 10 | SENSE- | Negative Remote Sense |
| 11 | SENSE+ | Positive Remote Sense |
| 12 | TRIM | Used to trim output voltage +10/-40\% |

Note:

1) Pinout as well as pin number and pin diameter are inconsistent between manufacturers of the full brick converters. Make sure to follow the pin function, not the pin number as well as spec for pin diameter when laying out your board.

## NOTES:

Unless otherwise specified:
All dimensions are in inches [millimeter]
Tolerances: $x . x x$ in. $\pm 0.02$ in. [x.x mm $\pm 0.5 \mathrm{~mm}$ ]
$x . x x x$ in. $\pm 0.010$ in. [x.xx mm $\pm 0.25 \mathrm{~mm}]$
Torque fasteners into threaded mounting inserts at 10 in .lbs. or less. Greater torque may result in damage to unit and void the warranty.
